

Things

Things

2024 — Ongoing

A simple web app to keep track of everything inside my cabinets, drawers, and storage boxes — basically a digital inventory for all the random things lying around. Still a work in progress, but already quite functional.

Built with **Vite**, **Vue 3**, and **TypeScript**, using **Naive UI** for the interface. Each storage space (like a drawer or cabinet) can have multiple containers or items, making it easy to quickly find where something is.

It's hosted [here](#) and the full source is available on [GitHub](#).

Notes:

- Built with Vite + Vue 3 + TypeScript
- Uses Naive UI components
- Item and container-based organization
- Web app hosted on Firebase
- Work in progress

Things

2024 — Ongoing / Web Application, Personal Tool

| A web app to create a personal digital inventory of items/parts in storage boxes, drawers, and cabinets, making it easy to find where things are.

(A screenshot of the app's interface would be perfect here, showing the organization of items and containers.)

The Story

This is a simple web app I'm building to keep track of everything inside my cabinets, drawers, and storage boxes. It's essentially a digital inventory for all the random things lying around, especially my collection of electronic parts. While still a work in progress, it's already quite functional. Each storage space (like a drawer) can contain multiple containers or individual items, making it

easy to quickly search for something and find its exact location. The app is built with a modern frontend stack and is hosted on Firebase.

Key Features

- **Hierarchical Organization:** Structure your inventory with spaces, containers, and items.
- **Fast Search:** Quickly find the location of any logged item.
- **Modern Interface:** Clean and responsive UI built with the Naive UI component library.
- **Live Deployment:** Accessible as a hosted web application.

Tech Stack

- **Frontend Framework:** Vue 3 (Composition API)
- **Build Tool:** Vite
- **Language:** TypeScript
- **UI Library:** Naive UI
- **Hosting:** Firebase Hosting

Challenges & Lessons Learned

The primary design challenge for this project is creating a data structure that is flexible enough to handle various types of storage (from a single box to a multi-shelf cabinet) while keeping the user interface for adding and finding items fast and intuitive. This project is an ongoing exploration in balancing data complexity with user experience for a highly practical, personal utility application.
