

Mondays

Mondays

March 2020 (Second version)

An app to record and analyze the stats from our weekly soccer games — goals, assists, wins, and more.

Originally built with SQL and a Node.js backend, it was later completely rebuilt using Firebase (NoSQL) to run entirely on the frontend. The app uses Google Auth for login, and each user sees results tailored to their participation: green for wins, yellow for draws, red for losses, and gray if they didn't play.

You can browse stats for an entire season, a single month, or overall totals. Each match includes a detailed summary for every goal — showing the minute, the assisting player (if any), and a timestamped link to the YouTube video of the game. There's also a formation tab showing both teams' lineups, and a stats tab ranking players by goals and assists for that specific match.

All code is available on [GitHub](#).

Notes:

- Built with Nuxt.js and Firebase (NoSQL)
- Google Auth integration with user-tailored views
- Fully frontend-based implementation (previously SQL + Node.js backend)
- Light and dark modes
- Per-season, monthly, and overall statistics
- Admin mode for match input
- Formation and detailed match summary views

Mondays

March 2020 (v2) / Web Application

An app to record and analyze stats for our weekly soccer games, including goals, assists, wins, and personalized user results.

(Here you would place a screenshot or a short GIF of the app in action)

The Story

This app was built to track the stats from our weekly soccer games—goals, assists, wins, and more. The original version was built with SQL and a Node.js backend, but I later rebuilt it entirely on the frontend using Firebase (NoSQL) for simplicity of hosting. The app uses Google Auth for login, and each user sees results tailored to their participation: green for wins, yellow for draws, red for losses, and gray if they didn't play.

Users can browse stats for an entire season, a single month, or their overall totals. Each match includes a detailed summary for every goal—showing the minute, the assisting player (if any), and a timestamped link to the YouTube video of the game. There's also a formation tab showing both teams' lineups and a stats tab ranking players for that specific match.

Key Features

- User-specific views with color-coded match results.
- Detailed match summaries with timestamped video links for goals.
- Team formation and per-match player stat rankings.
- Statistics filtering by season, month, or overall.
- Admin mode for easy input of match data.
- Light and dark mode support.

Tech Stack

- **Framework:** Nuxt.js (Vue.js, Naive UI)
- **Backend & Database:** Firebase (Firestore, Google Authentication)
- **Hosting:** Firebase Hosting

Challenges & Lessons Learned

The most significant challenge and learning experience was migrating the entire application from a traditional SQL + Node.js backend to a purely frontend architecture with Firebase. This taught me a great deal about NoSQL data

modeling and the benefits of serverless platforms for rapid development and deployment.
